

Value-Based Care Reporting

Azara DRVS' Value-Based Care Reporting functionality facilitates collaboration between providers and health plans in service of value-based care contracts. Through the ingestion of enrollment, care gaps, and claims data, alongside existing EHR data, DRVS can serve as the whole-population hub for providers' quality and risk-sharing initiatives. While the tools available depend on what data is shared by health plans, the goal is the same: unify and simplify the data care teams need to succeed in value-based care.

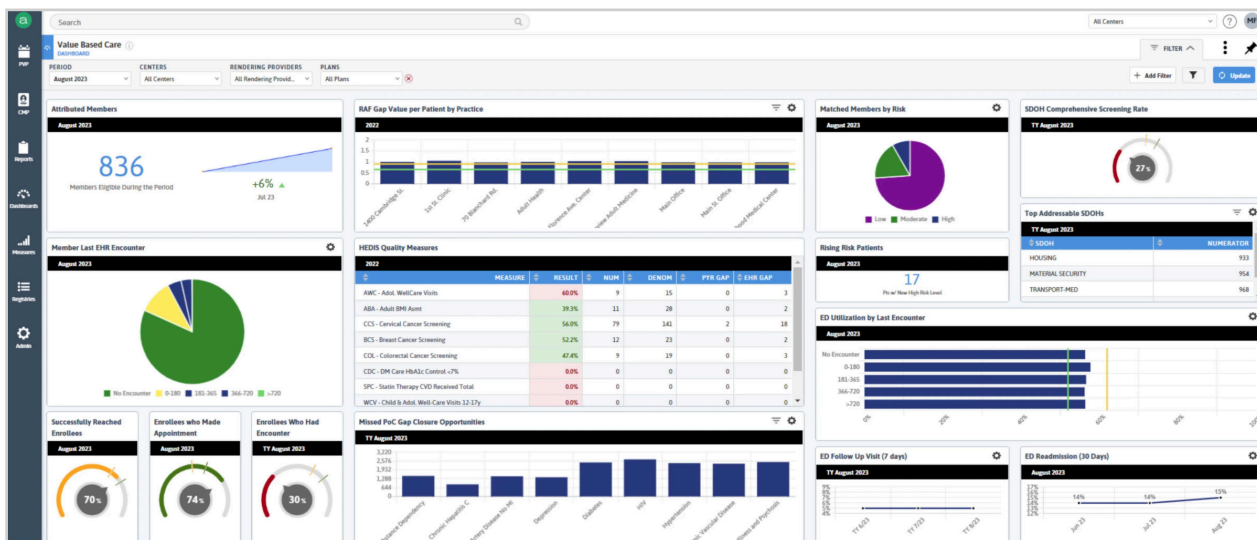

Azara solutions empower organizations to succeed in multi-payer value-based care environments by:

- Identifying attributed, but never seen, members and matching health plan enrollment to EHR medical records
- Reconciling care gaps between health plan and EHR data sources
- Surfacing risk-adjustment factor (RAF) gaps for a patient through either HCC or CDPS algorithms
- Calculating certified HEDIS measures from an integrated set of clinical and claims data
- Predicting which patients/members will be heavy utilizers and drive total cost of care
- Providing supplemental data to health plans via NCQA Data Aggregator Validation Program certified CCDs

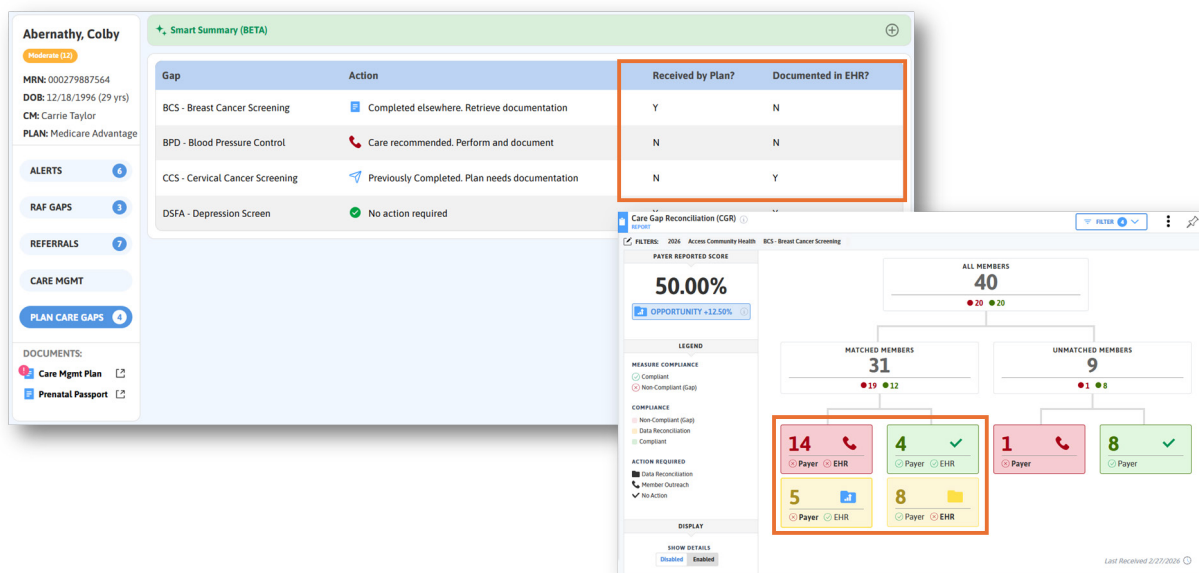

Organizations use Azara solutions to engage with health plans and members – improving care by enabling providers to:

Unify member insights by aggregating and standardizing supplemental data directly from health plans– empowering care teams with a comprehensive and timely understanding of patients’ conditions and risk factors.

Plug-In Plan Care Gaps surfaces the status of care gaps as reported in the Care Gap Reconciliation (CGR) Report for a given patient, based on records found in the EHR and received from the Payer. This new section can help prompt care team members to document, conduct outreach, and provide the care needed to close gaps and improve measure performance.

Azara DRVS supports value-based care success with an experienced Clinical Transformation team and a comprehensive library of over 600 measures – including over 50 certified HEDIS® measures, CMS eCQM measures used for MSSP, MCP, & PCF programs, and a broad range of other clinical quality measures, covering all health plan members.
